

IN THE SPECIFICATION:

Please correct paragraph [0018] as shown in the following paragraph.

[0018] In order to permit the opening of the door, it is known from the prior art to provide a lifting magnet 8 in the case of the release device 2, which lifting magnet 8, by means of a mechanism which, as a whole, is called a linkage or lever 9, moves the non-rotatable toothed disc 3 against the force of the contact pressure springs 5 axially so far away from the toothed spindle disc 6 that, as illustrated in FIG. 1, the combs of the tothing have little play in the axial direction with respect to one another, so that the spindle disc 6 can also rotate in the direction blocked by the ~~(not shown)~~ freewheel 1. The parts of the freewheel 1 away from the door rotate along in this case, so that the entire freewheel 1 rotates along with the spindle 1.
